

KAEDEN'S PRODUCTION SYSTEM

THE VANOSS METHOD

Comedy Editing Playbook — Bucket 2 Specialization

PRODUCTION BIBLE ADDENDUM • V1.0 • JULY 2026
DECODED FROM 14+ YEARS OF VANOSSGAMING
TRANSLATED FOR KAEDEN'S RIG • UPDATED FOR 2026 YOUTUBE
PAIRS WITH: PRODUCTION BIBLE + BIBLE 2.0: THE SYSTEM

RED — RULES & PEAKS BLUE — STRUCTURE GREEN — ACTION YELLOW — MINDSET

"FILM A HANGOUT. EDIT A SKETCH SHOW."

ALL RIGHTS TO KAEDEN • BUILT WITH CLAUDE

HOW TO USE THIS DOCUMENT

This is an addendum to your Production Bible, not a replacement. Your Bible covers the whole channel. This document specializes one lane: **Bucket 2 — Chaos & Co-op**, edited the Vanoss way with a modern twist. Everything here plugs into systems you already run: Package 2 (Bill Chaos), Template F (Co-op Disaster), the 4-color marker system, the 14-day loop from Bible 2.0, and your OBS multi-track setup.

The one-line philosophy of this entire document:

Film a hangout. Edit a sketch show.

THE DECODE

What VanossGaming actually is

// The short history (5 eras)

Era 1 — The Grind (2011–2013). Evan Fong registers VanossGaming in September 2011. Call of Duty commentary and funny moments, early GTA. Signs with Machinima. Editing is simple: cut the boring parts, keep the funny parts. The seed of everything is already there.

Era 2 — The Golden Formula (2013–2016). GTA V Online and Garry's Mod. The crew locks in (H2O Delirious, Wildcat, Terroriser, Nogla, Moo Snuckel, BasicallyIDoWrk and others). The format crystallizes: 8–15 minute "Funny Moments" montages built from long group sessions. Branded 3D animal-avatar thumbnails. Rotating outro songs over a consistent endcard ritual. This is the era everyone means when they say "Vanoss-style editing."

Era 3 — Refinement (2016–2019). Same bones, cleaner execution. Sound design gets more confident. The brief bass-boost/meme-edit flirtation of mid-2010s YouTube passes through and mostly gets dropped — restraint wins. He starts music production as Rynx and even uses his own tracks in outros.

Era 4 — Delegation (2019–2022). Upload pace becomes less relentless. In early 2022 he publicly recruits an editor for the channel — after roughly a decade of hands-on editing, the system is defined enough to hand off. That only works because the style is a repeatable formula, which is exactly why you can learn it.

Era 5 — Legacy Mode (2022–now). ~26M subscribers, ~17B lifetime views. Uploads are less frequent but the format is untouched: GTA, zombies, and — importantly — **Uno**. Read that again: one of YouTube's biggest gaming channels gets millions of views on Uno. The game was never the product. The friends and the edit are the product. His back catalog still circulates in recommendations years later because the videos are rewatchable comfort food.

// His own stated philosophy (paraphrased from interviews)

- His content is fast funny-moment videos that **eliminate downtime** — anything uninteresting gets cut.
- He chose montage format over let's-plays deliberately: viewers have short attention spans and busy lives, so the video should be **exciting the entire time**.
- Editing one video could take him **most of a full day**; bigger projects up to a week. The edit is where the work is.
- The real engine, in his words, is the genuine feeling of friends hanging out — that connection has always been the leading energy of the content, and modern audiences want to feel like they know the people they watch.

// The single most important realization

Vanoss is not a gamer who edits. **He's a comedy editor whose actors happen to be his friends' game avatars.** The recording session is a sitcom taping — nobody knows which takes will make the show. The edit is where the show gets made. If you internalize only one thing from this document, make it that.

(Note on software: he's never prominently confirmed his editor; community tutorials of his golden era recreate his style in Vegas Pro. It doesn't matter — every technique in this document is editor-agnostic and DaVinci Resolve does all of it, usually better.)

THE 10 PILLARS

The decoded editing formula

// Pillar 1 — Bit Architecture

A Vanoss video is not one story. It's a **playlist of 6–12 self-contained sketches ("bits")**, each 30 seconds to 3 minutes, each with its own setup → escalation → punchline → optional tag. This is the deepest structural difference from MrBeast-style videos (one big arc). You're making a sketch show, and the game session is your writers' room.

// Pillar 2 — Kill All Downtime

His stated #1 rule. Every second between laughs is a cost. Loading screens, walking, menus, half-formed sentences, waiting for the round to start — gone. **Context is a tax; pay the minimum.** A 2.5-hour session becomes 9 minutes. That ratio (roughly 15:1) is normal for this style.

// Pillar 3 — The Reaction IS the Punchline

The ragdoll flying off the cliff is not the joke. **Delirious's laugh half a second later is the joke.** Wildcat's rage is the joke. Evan's wheeze is the joke. The event is setup; the human reaction is payoff. This changes where you cut: always cut after the reaction peaks, never right after the event.

// Pillar 4 — Silence & The Hold

Vanoss holds on awkward silences deliberately. A plan fails, and instead of cutting away — three full seconds of nobody talking. Music cutting to dead silence at the moment of disaster. Silence is his most underrated effect and it costs nothing.

// Pillar 5 — Replay & Perspective

"Let's see that again." Instant replays, slow-motion, and alternate camera angles of the same moment. In Garry's Mod he could replay session demos with a free camera; in GTA V the built-in Rockstar Editor does the same. **The replay serves one purpose: making sure the viewer fully saw the funny thing.** If they already saw it clearly, no replay.

// Pillar 6 — In-Game Cinematography

The avatars are actors, so he films them like actors: cutting to the character who's talking, framing the chaos wide, punching in on a face for a beat. Third-person and spectator cameras used like a sitcom camera operator. The game world is a set.

// Pillar 7 — Sound Design Economy

SFX punctuate; they don't decorate. One well-placed cartoon hit or sting on the punchline beats twenty random boings. Music runs under a bit to set temperature, then **hard-cuts to silence** at the disaster moment — that cut is itself a joke. Restraint here is the whole skill.

// Pillar 8 — Character Continuity

Delirious = the laugh. Wildcat = the rage. Nogla = the fails. Terroriser = the voices. These personas weren't scripted; they were **built by edit selection over years** — Evan kept the moments that proved each character, and the audience learned who everyone was. Running gags and callbacks across videos turn viewers into insiders. Continuity compounds like interest.

// Pillar 9 — Restraint Over Stimulation

Even at the peak of MLG-meme-edit YouTube, Vanoss stayed relatively clean, and he dropped what little of it he tried. He never explains a joke with on-screen text. In 2026 this aging philosophy is now cutting-edge again: MrBeast publicly walked back overstimulation editing in 2024, and YouTube's algorithm now weighs viewer satisfaction. Your Bible 2.0 already bakes this in — Vanoss just got there 10 years early.

// Pillar 10 — Ritual Packaging

Branded avatar thumbnail art viewers could spot instantly. Episodic search-era titles ("[Game] Funny Moments — thing, thing, thing"). A consistent outro ritual — the specific song rotated over the years (Afterglow in 2014, E-Dubble era tracks, later his own Rynx songs) but the ritual never changed: same structure, same vibe, every video. Rituals build a channel identity that survives any individual video.

INSIDE HIS HEAD

The 12 decision rules (reverse-engineered)

Honesty note: Evan has never published an editing manual. These rules are inferred from watching the videos, his interviews, and how the style behaves — treat them as a reconstruction that produces his results, not his literal words.

For every clip on the timeline, the Vanoss-style editor is asking:

1. **"Did anyone actually laugh?"** — A real laugh on the recording is the truth signal. No genuine laugh during the session = the bit is dead. You don't decide what's funny in the edit; the session already told you.
2. **"What's the punchline?"** — Find it FIRST. Build the bit backward from it.
3. **"What's the minimum setup?"** — Usually 5–20 seconds. If setup is longer than the payoff deserves, trim or kill.
4. **"Can I enter later and leave earlier?"** — Classic screenwriting rule. Every bit starts as late as possible and ends as early as possible.
5. **"Did the viewer actually see it?"** — Missable joke → replay, slow-mo, or zoom. Obvious joke → touch nothing.
6. **"Whose reaction sells it?"** — Solo the funniest voice; duck everything competing with it.
7. **"Is silence funnier here?"** — Surprisingly often, yes.
8. **"Is this a callback opportunity?"** — One line of audio from an earlier bit, or a repeated SFX, stitches bits into a shared world.
9. **"Strong open, strongest close."** — Order bits like a comedy set. Weakest material hides in the middle-back or gets cut.
10. **"Would someone rewatch this?"** — His catalog still pulls views a decade later because the videos work as comfort food. Rewatchability > cleverness.
11. **"One effect per joke, max."** — Zoom OR freeze OR SFX OR music cut. Stacking effects smothers timing.
12. **"Does this feel like hanging out?"** — The final vibe check. The friendship is the product. If an edit choice makes it feel produced instead of lived, undo it.

THE MODERN TWIST

The 2013 formula, updated for 2026

// KEEP (aged perfectly)

- Bit architecture, downtime purge, reaction-first cutting
- Restraint over stimulation (now algorithm-validated)
- Character building and callbacks
- Replays and in-game cinematography
- The ritual outro concept (yours can be 5 seconds, not 40)

// UPDATE (aged, needs a patch)

The open. Golden-era Vanoss often just started at bit #1. In 2026, non-subscribed browse traffic decides your video's fate in 30 seconds. **Modern patch:** cold-open with a 5–15 second tease of your best moment (cut before the punchline lands), snap to bit 1. This is the MrBeast hero-clip rule from your Bible, welded onto Vanoss structure.

Titles. His episodic "[Game] Funny Moments — X, Y, Z" titles were built for the search era. You live in the browse/suggested era. **Modern patch:** story-first curiosity titles per Bible Section 13 ("We Should NOT Have Given Bill the Keys"), game name in the thumbnail and description instead. But steal his deeper idea: a **recognizable recurring series identity** so returning viewers spot your format instantly.

Thumbnails. He had commissioned 3D avatar art — a real budget item. Your equivalent is already in the Bible: consistent facecam expression style + Bill + the 3 C's. Consistency is the branding, not the budget.

Pacing for strangers. His mid-era videos could assume subscribers. You can't. **Modern patch:** bit transitions ARE your re-engagement beats (one every ~2–3 minutes lands automatically if your bits are 2–3 minutes) — plus one verbal re-hook line per Bible Section 15 when energy dips.

Captions. Huge share of 2026 viewing is muted. Punchline-adjacent dialogue gets captions. You already own the pipeline (Subtitles.drb).

// ADD (didn't exist in his prime)

The Shorts pipeline. Shorts launched long after his formula was set — you get an advantage he never had. **Every bit that passes your Bible's 60-second self-contained test is a Short.** A 10-bit video should shed 2–4 Shorts with near-zero extra work (green markers → Aitum vertical → captions → ship).

The feedback loop. He iterated on instinct for years. You have the 48-Hour Post-Upload Check and retention graphs. Bit-structured videos give you unusually readable retention data: each dip aligns with a specific bit — you learn which kinds of bits your audience skips. No 2013 creator had that resolution.

THE KAEDEN TRANSLATION LAYER

Every Vanoss technique → the gear you already own

VANOSS ELEMENT	YOUR TOOL (ALREADY INSTALLED)
Friends' voices isolated for comedy timing	T4 Discord track (Bill) — he had to sync everyone's separate recordings by hand; OBS hands you this for free. This is your single biggest unfair advantage.
His own reaction audio, clean	T2 Blue Snowball with your settled filter chain
Reaction close-ups	Source Record facecam file — his era was avatars-only; your modern twist is a sparing facecam punch-in on your genuine laugh (1–2 per video, not constant PiP)
GMod demo free-cam / GTA Rockstar Editor replays	ReForgedPlay (Forge/Verity instance), Flashback (Fabric), Fortnite Replay Mode (built-in, free, incredible for this). Roblox has no replay system — compensate with your facecam + a spectating second account when possible
Zoom punch-ins on punchlines	MagicZoom
Slow-mo "let's see that again"	Retime Controls + speed points + Optical Flow (you already know this workflow — remember to cut the audio at the ramp and drop an SFX/music hit)
Freeze frames	Retime → Freeze Frame
Cartoon hits & stings	T7 → SFX → Comedy / Gaming
Music beds & hard cuts	T7 → MUSIC → Goofy / Happy (bed runs under bit, hard-cut to silence at the disaster)
Flagging funny moments live	StreamUP hotkeys (BEST MOMENT on every real laugh, SHORTS WORTHY, INTERESTING) + "that's a clip" out loud
Selecting bits in post	Your 4-color markers, remapped for comedy: Red = punchline moment, Blue = its setup, Green = Shorts candidate, Yellow = maybe
Assembly & polish phases	Bible 2.0 stations: Triage = build the Bit List, Story Cut = assemble bits, Energy = Pillar 7 sound pass
The whole format	Package 2 (Bill Chaos) + Template F (Co-op Disaster) — your Bible already predicted this lane; this playbook is its editing engine

Notice what this table means: you don't need to buy or install anything. Your recording rig was accidentally built for Vanoss-style editing. The gap was never tools — it was the cutting philosophy, which is what Parts 2, 3, and 7 give you.

STEP BY STEP

Your first Vanoss-style video, start to finish

// STEP 0 — Pick the sandbox (2 min)

Rule: pick games where funny things happen TO you, not games you must make funny. You want emergent chaos: physics, betrayal mechanics, co-op jobs with shared failure, horror with a friend. From your roster: Fortnite with Bill (bonus: built-in Replay Mode), modded Minecraft (your Verity session is literally already a Vanoss-style situation design), Roblox co-op horror and party games. Uno-tier simple games work too — Vanoss proved it — IF the call is strong that day.

// STEP 1 — Phase 1 sheet (5 min, straight from Bible Section 9)

Package 2 (Bill Chaos). Premise/Promise/Angle. Run the 3-yes check. Write 3+ flexible titles and a thumbnail sentence. Nothing new here — your existing system.

// STEP 2 — Design the SESSION, not the jokes (10 min)

Never script comedy. Script **situations** — a list of 4–6 activities/scenarios/challenges for the session, ~20–30 minutes each. Different games, different modes, different self-imposed rules. Why: **more situations = more bits**, and variety means a dead scenario costs you 20 minutes, not the whole session. Include at least one situation that forces interaction or shared failure (one controls X, the other controls Y; shared health; a bet). Then follow your own Bible Section 26: don't over-explain the plan to Bill — confusion is content — and never correct him mid-disaster.

// STEP 3 — Record the taping (2–3 hrs)

- Both POVs if possible: Bill runs a basic OBS local recording (game + his mic, one-time 10-minute setup on his end). If that's too much friction, your T4 Discord track already covers his voice, which is 80% of his comedic value.
- **The golden habit: every time you laugh for real, hit BEST MOMENT.** Your genuine laugh is the edit's truth signal (Decision Rule #1). Don't judge it in the moment — flag it and move on.
- Narrate stakes, react out loud, callbacks out loud — your 3 Anchors from Bible Section 10 apply unchanged.

// STEP 4 — Triage, next day (45–60 min — Bible 2.0 Triage station)

Watch at 1.5–2x. Build the **BIT LIST** — a plain note (Notion or paper):

BIT NAME	TIMECODE	THE PUNCHLINE (one line)	GRADE
"Bill vs. door"	00:14:20	door kills him, 8s silence	A
"backwards plan"	00:31:05	plan works, we're more confused	B
"the betrayal"	01:02:40	Bill was the traitor all along	A

Target: **6–10 usable bits** from a 2-hour session. Grade honestly: A = made you laugh again on rewatch, B = smiled, C = "it was funnier live."

The flexibility valve: fewer than 4 A/B bits? Don't force a video. That session becomes Shorts-only and the footage bank grows. Sessions never fail — only bits die. (This is your "gate series on performance" principle applied one level down.)

// STEP 5 — Assemble (Story Cut station)

Timeline order: 1. **Cold open:** 5–15s of your #1 A-bit, cut before the punchline lands 2. **Bit slot 1:** your second-best bit (strong open) 3. Middle: remaining A/B bits, alternating energy (loud bit → quiet bit → loud) 4. **Final slot:** your best bit, punchline in full (strongest close — and now the cold open pays off) 5. End 1–2s after the final reaction. Endscreen overlays the tail. No outro padding — your Bible's Punchline Rule.

Rough cut the whole thing before polishing anything (Bible Step 6, unchanged).

// STEP 6 — Edit each bit with the Per-Bit Recipe (Part 7, below)

This is where the Vanoss magic actually lives. One bit at a time, seven moves each.

// STEP 7 — Energy pass (Energy station)

One pass over the finished cut: music bed decisions (per bit: music or no music — not per moment), SFX only on punchlines, MagicZoom max ~1 per bit, facecam punch-in 1–2 per video, captions on punchline dialogue, then your standard audio targets (voice -12 to -10, music -20 to -18, game -18 to -16, -14 LUFS).

// STEP 8 — Package & ship

Bible Sections 13–14 + Upload Checklist, unchanged. Then pull the green-marked bits as 2–4 Shorts through your Aitum vertical pipeline. Run the 48-Hour Check and note which bit types held retention — that's next session's design input.

THE PER-BIT EDIT RECIPE

The core teachable unit: 7 moves, every bit, every time

Print this. Tape it near the monitor. This IS Vanoss editing.

MOVE 1 — Find the punchline frame. Park the playhead on the exact moment the joke lands. Everything orbits this frame.

MOVE 2 — Set the OUT point. 1–2 seconds after the reaction peaks — let the laugh land fully, cut before it decays. (Pillar 3: the reaction is the punchline.)

MOVE 3 — Walk backward, set the IN point. The latest possible moment the joke still makes sense. Usually 5–20 seconds of setup. Enter late.

MOVE 4 — Purge internal downtime. Cut silences and filler inside the bit — with one exception: **silence immediately before a punchline is load-bearing. Protect it.** (Pillar 4.)

MOVE 5 — The missability check. Could a viewer have missed the funny thing? YES → deploy exactly one recovery tool: slow-mo replay (Retime), zoom (MagicZoom), or freeze frame. NO → touch nothing. Most bits need nothing.

MOVE 6 — One sound decision. SFX hit on the punchline, OR music hard-cut to silence at the disaster, OR nothing. "Nothing" is a professional choice, not a lazy one.

MOVE 7 — The full-speed watch. Play the bit start to finish at 1x. If you don't at least smile → cut deeper or kill the bit entirely. No sunk-cost mercy. Bits die; the video gets stronger.

Time budget once practiced: **5–15 minutes per bit.** A 9-bit video ≈ one solid editing session, which fits your 14-day loop cleanly.

BILL AS YOUR DELIRIOUS

Building a character the Vanoss way

The crew's personas weren't cast or scripted — they were **built by a decade of edit selection**. Evan kept the moments that proved each character until the audience knew them on sight. You can compress that timeline deliberately:

1. **Name Bill's editorial identity from his real tendencies.** Your dynamic already exists: Bill = the Chaos Agent, you = the Reactor (Bible Section 26 roles). The edit's job is to keep proving it.
2. **Give Bill an audio signature.** Pick ONE sting or SFX from T7 that plays only on peak Bill moments. Use it consistently for 3 videos and it becomes a channel in-joke — the leitmotif trick, and the fastest character-building tool that exists.
3. **Keep a "Bill Lore" list in Notion.** Every legendary Bill moment, one line each. Reference them out loud in future sessions ("this is the door thing all over again") — callbacks on camera become callbacks in the edit for free.
4. **Don't use his name in titles yet.** "He Should NOT Be Allowed Near a Door" outperforms "Bill Does X" until the audience knows Bill — your Bible already has this rule. Graduate to his name when comments start asking for him. That's the metric.

THE DON'TS

What breaks the style

- × **Don't script jokes.** Script situations. Scripted punchlines read as fake instantly in this format.
- × **Don't stack effects.** One joke, one effect, maximum. Two effects on one punchline = zero effects.
- × **Don't explain jokes with text.** Your 3–5 Text+ ceiling stands; use text to amplify a line, never to explain it.
- × **Don't keep a bit because recording it was fun.** The session laugh nominates the bit; the Move-7 rewatch confirms or kills it. Both votes required.
- × **Don't cosplay 2015 meme editing.** Bass boosts, spam zooms, deep-fried frames — even Vanoss shed that skin, and the 2026 satisfaction-weighted algorithm actively punishes it. Your Bible 2.0 already made this call.
- × **Don't pad runtime.** A dense 7-minute banger beats a bloated 12. Vanoss's golden-era videos were often 6–9 minutes of zero downtime. Length is an output of bit count, never a target.
- × **Don't perform a fake laugh.** Rule #1 depends on your real laugh being trustworthy — to the edit and to the audience.

QUICK CARDS

// RECORDING DAY CARD

- ☑ Phase 1 sheet done (package, premise, 3 titles, thumbnail sentence)
- ☑ 4–6 situations listed for the session
- ☑ At least one forced-interaction / shared-failure situation
- ☑ Bill knows the goal, NOT the plan details
- ☑ OBS: tracks verified (T2 mic, T3 game, T4 Discord), Source Record armed, Hybrid MP4 on
- ☑ StreamUP hotkeys ready — **hit BEST MOMENT on every real laugh**
- ☑ Bill's local recording running (if set up)

// EDITING DAY CARD

- ☑ Triage at 1.5–2x → Bit List with grades (target 6–10 bits)
- ☑ Fewer than 4 A/B bits? → Shorts-only session, stop here
- ☑ Assembly order: tease → 2nd-best → middle (alternate energy) → best → hard end
- ☑ Per-Bit Recipe, 7 moves, every bit
- ☑ Energy pass: music per bit, SFX on punchlines only, ≤1 zoom per bit, captions
- ☑ A6 camera-bleed track deleted; audio targets; –14 LUFS check
- ☑ Green bits → Shorts pipeline

// IS THIS BIT DEAD? (3 questions)

1. Did someone genuinely laugh during the session? (No → dead)
2. Can I state the punchline in one sentence? (No → dead)
3. Did the Move-7 full-speed rewatch get at least a smile? (No → dead)

// THE PHILOSOPHY, ONE MORE TIME

Film a hangout. Edit a sketch show. Enter late. Leave after the laugh. Protect the silence before the punchline. One effect per joke. The reaction is the punchline. Bits die so videos can live.

Addendum v1.0 — built July 2026. Pairs with: Production Bible (Sections 9, 10, 13–15, 26, 30) and Bible 2.0 (Triage / Story Cut / Energy stations). Flexible by design: every number in this document is a starting default, not a law — your retention graphs get the final vote.
